Product Designer & Frontend Engineer

I design product interfaces and build them myself, from the first conversation with users to production code. Based in Vienna, building for the web since 2021.

WHITE-LABEL SAAS

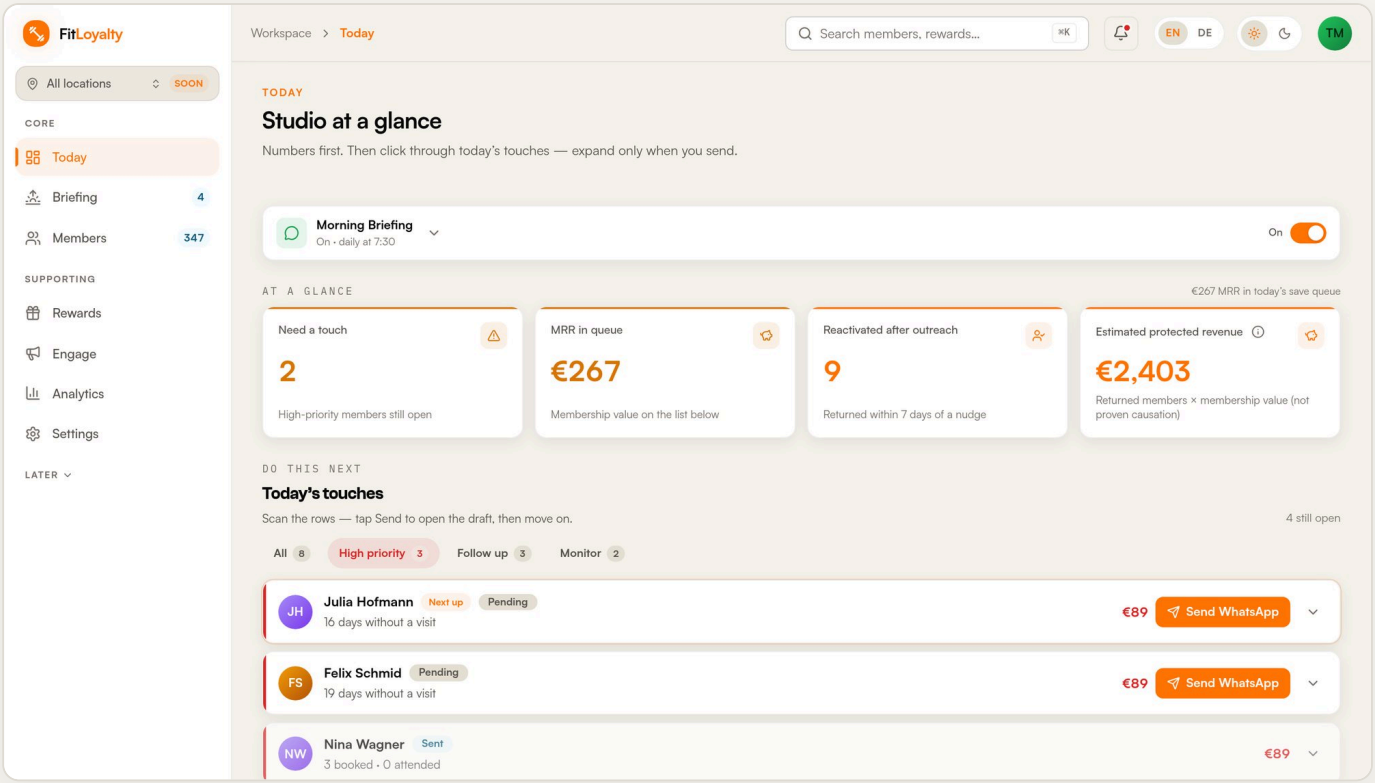

One product, many studio brands

A retention platform for independent fitness studios: the owner sees who is about to drop out and what it costs, the members get an app in the studio's own brand.

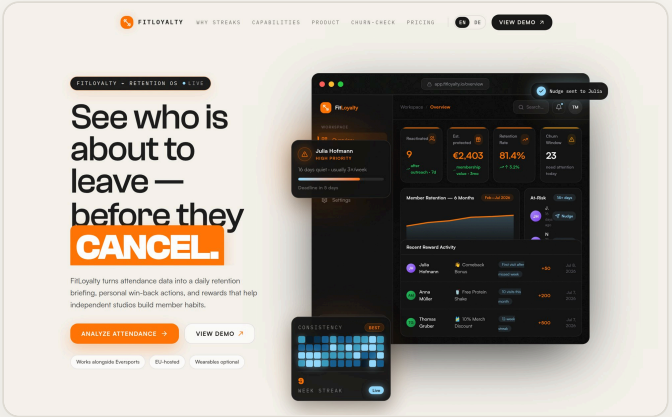

Role: concept, product design, frontend
Status: working demo with simulated data

- **Numbers first, then today's actions.** The overview answers "who needs a touch today and how much revenue is at stake", and each row opens a ready message.
- **Branding as a setting, not a fork.** Studios set colour, app name and logo; the live preview shows the member app in their brand before they save.
- **Privacy by design.** The churn check reads the studio's CSV in the browser, so member data never leaves the device.

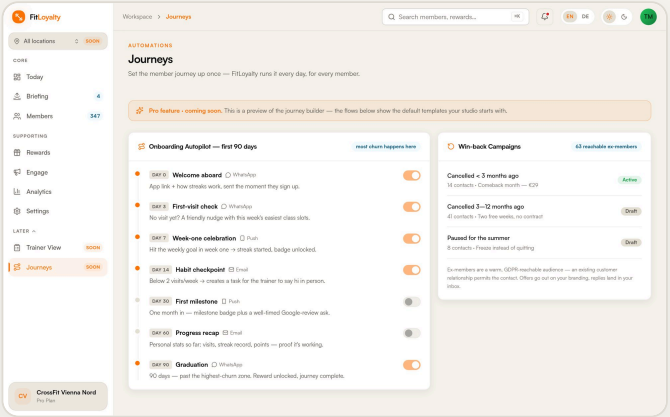

Stack Next.js, TypeScript, Tailwind v4, Radix / shadcn, Motion, Recharts, Zod

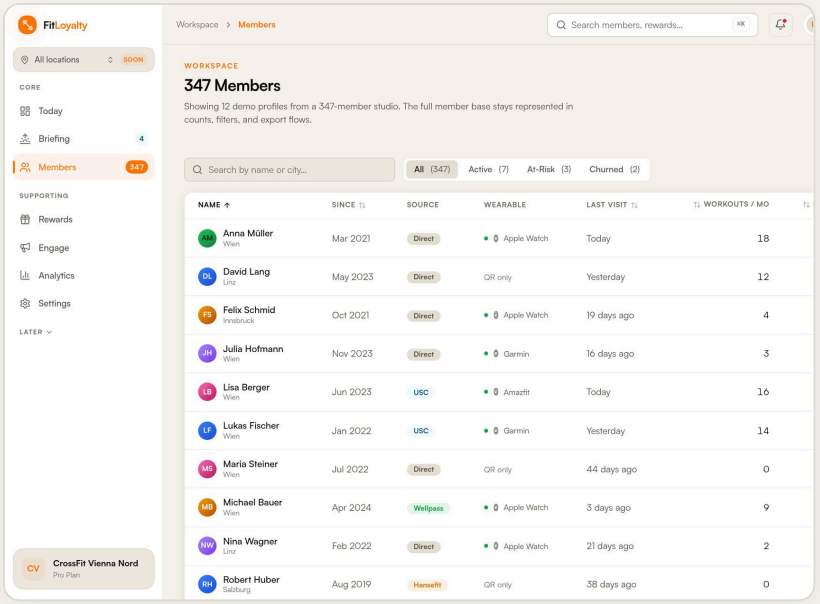

Owner dashboard — today's overview

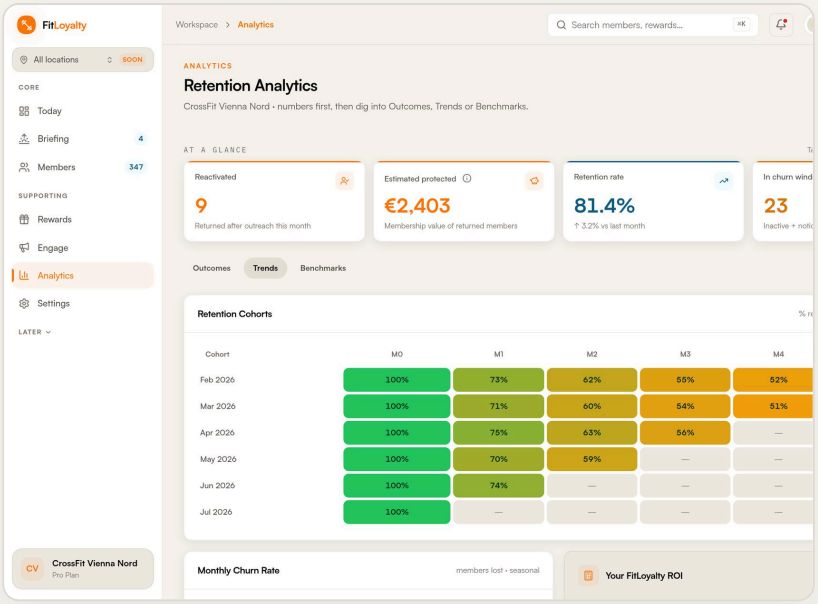

Landing page — sells the product with live mockups

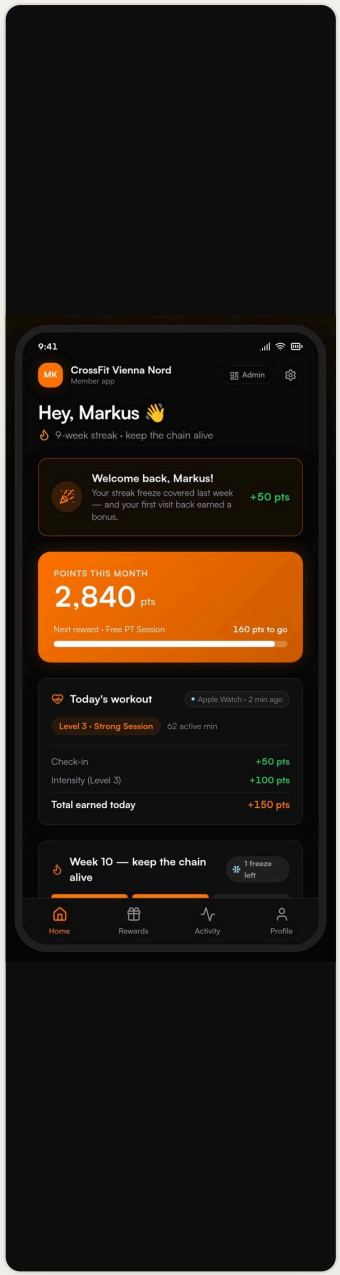

Journeys — onboarding and win-back flows (preview)

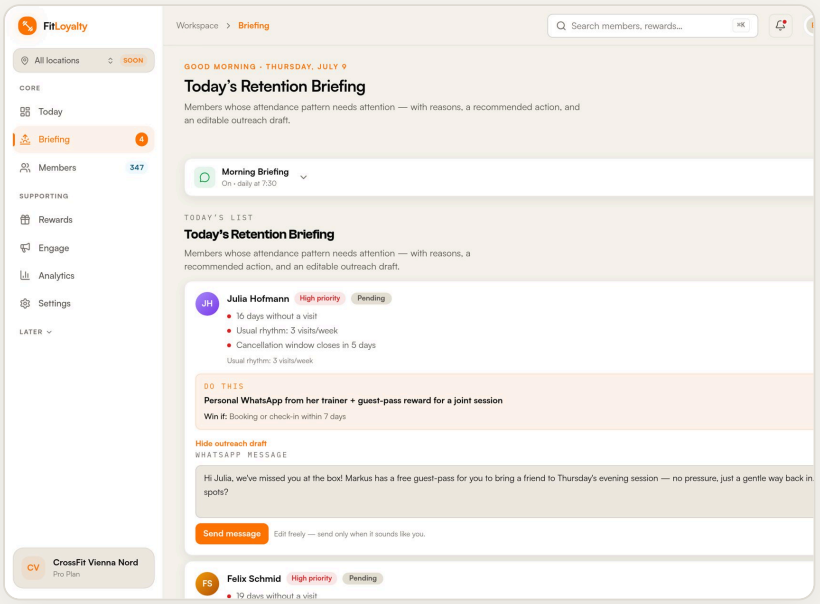

Members — search, sort and at-risk filters

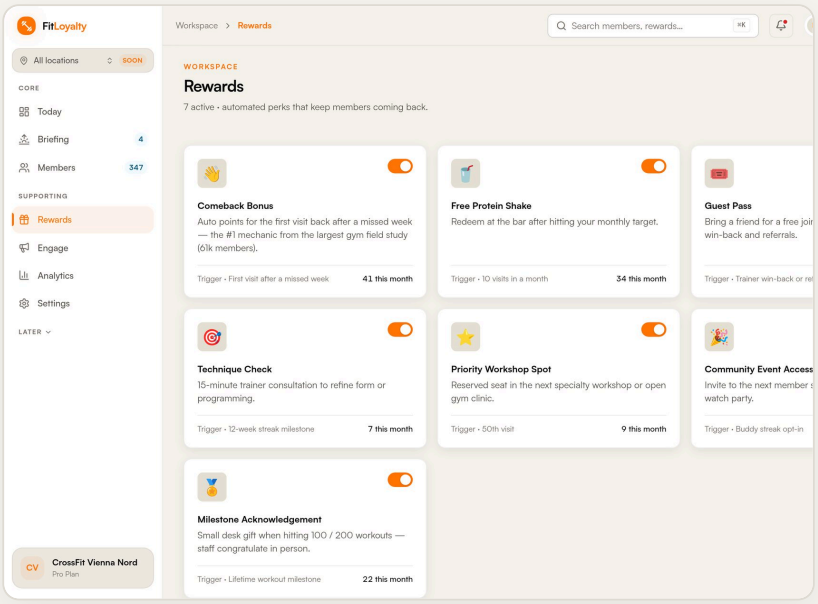

Analytics — retention cohorts by signup month

Member app (PWA)

Morning briefing — ranked actions for the day

Rewards — automated perks that bring members back

PUBLIC WEBSITE, IN PRODUCTION

A website that sounds like the agency

One of two developers at a 50-person Vienna agency. Rebuilt the website from Webflow on Next.js and Sanity, in German and English: bold type, video everywhere, an interactive 3D footer, and case pages the team fills in themselves.

- **One component library** shared with the client portal and internal tools.
- **About 300 tests** run in CI before every build; I also led the SEO side of the migration.
- **Also the internal tools** the team runs on: a content portal for clients and account managers (built almost from scratch), a community inbox for TikTok and Instagram comments, and the interface of our GEO tool. Not shown here, as they contain client data.

Home, services grid, a case brief and the interactive 3D footer

AI PRODUCTION TOOL

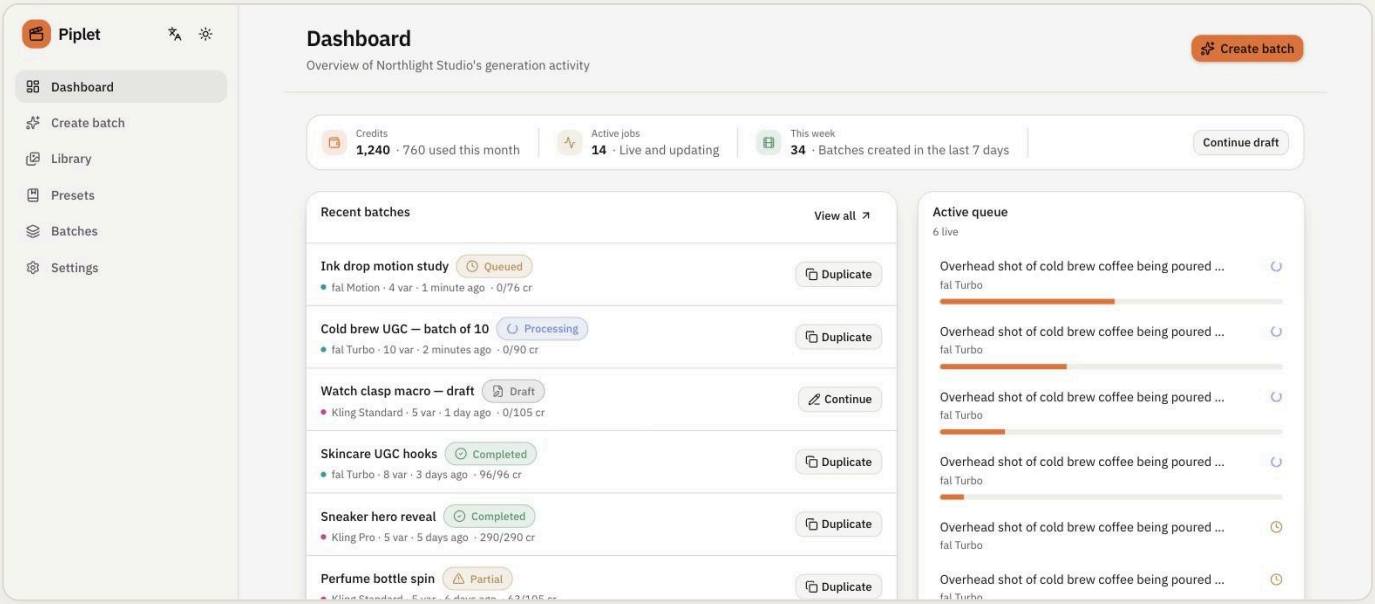

Making a complex process feel calm

A command centre for teams producing social-media ads with AI video: one brief becomes 5—10 variants, generated through different providers and tracked until they are ready to review.

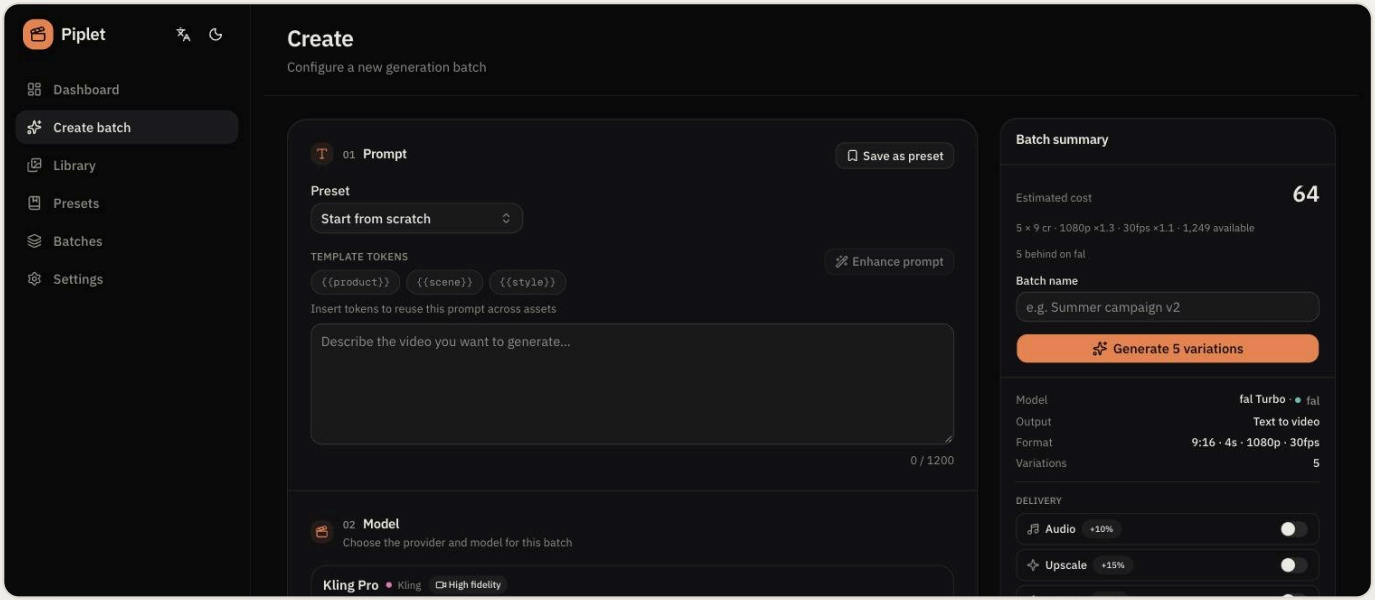

Role: product design and frontend
Status: demo, providers simulated

- **The form adapts to the model.** Every field on the create screen comes from what the selected model can do, so the user never sees an option that will fail.
- **Cost before commitment.** Live price and queue estimate update while the batch is configured.
- **Every job has a visible state** — queued, processing, ready or failed — with retry and cancel, and credits are refunded automatically on failure.

Stack Next.js Server Actions, TypeScript, Zod domain schemas, provider adapters

Dashboard — credits, active queue, recent batches

Create batch — capability-driven form with live cost (dark mode)

INTERNAL PRODUCT, USED DAILY

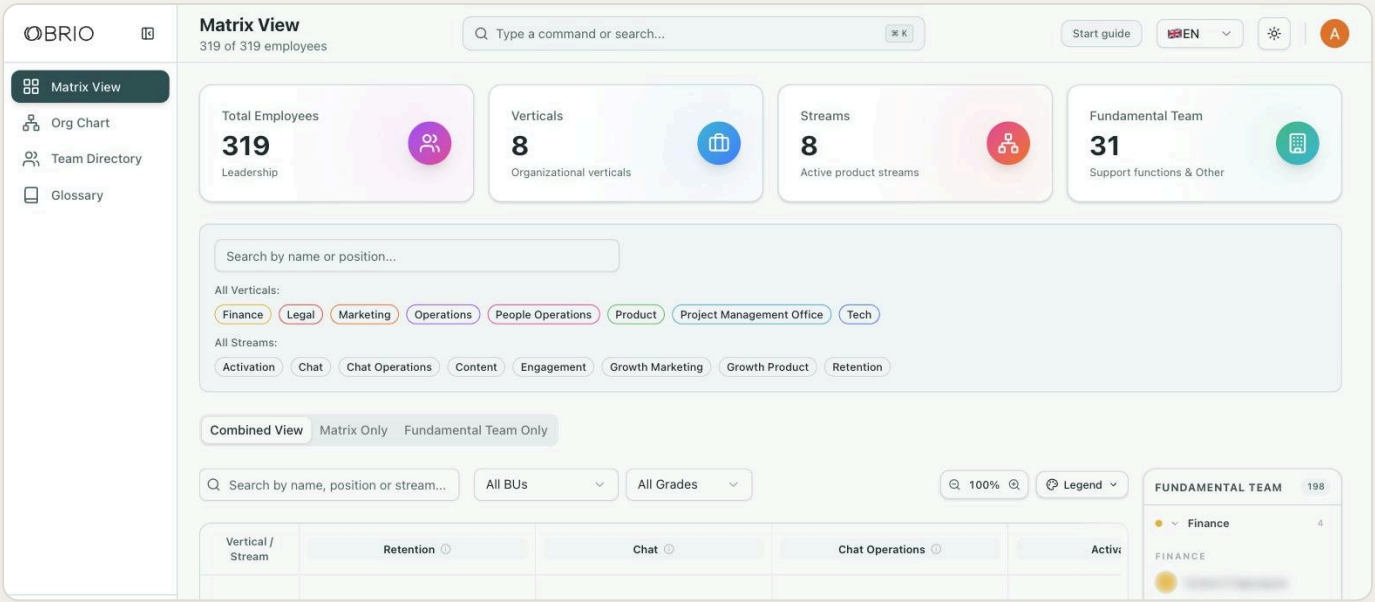

Who works on what, for 300+ people

An internal dashboard that helps employees understand a company organised by functions and product streams at the same time.

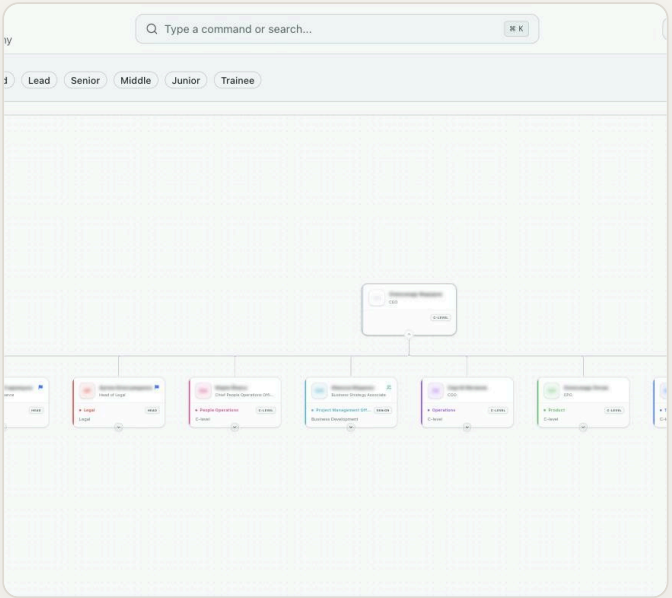

Role: product UX/UI, information architecture, frontend
Access: Google SSO, company domain only

- **A matrix instead of a tree.** Verticals × product streams show how the company actually works, not only who reports to whom.
- **Three ways to find someone:** the matrix, a classic org chart for hierarchy, and a searchable directory with filters by vertical, stream and grade.
- **A shared vocabulary.** A glossary explains internal terms for new joiners.

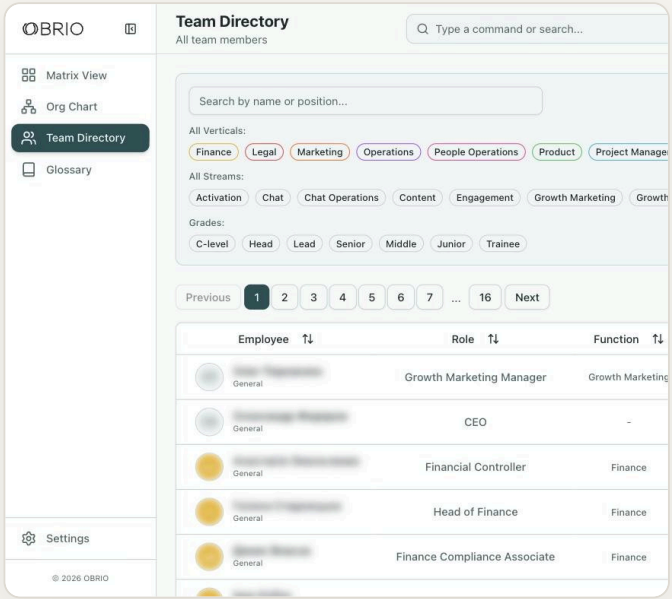

Stack Next.js, TypeScript, Google SSO • Names and emails blurred

Org chart

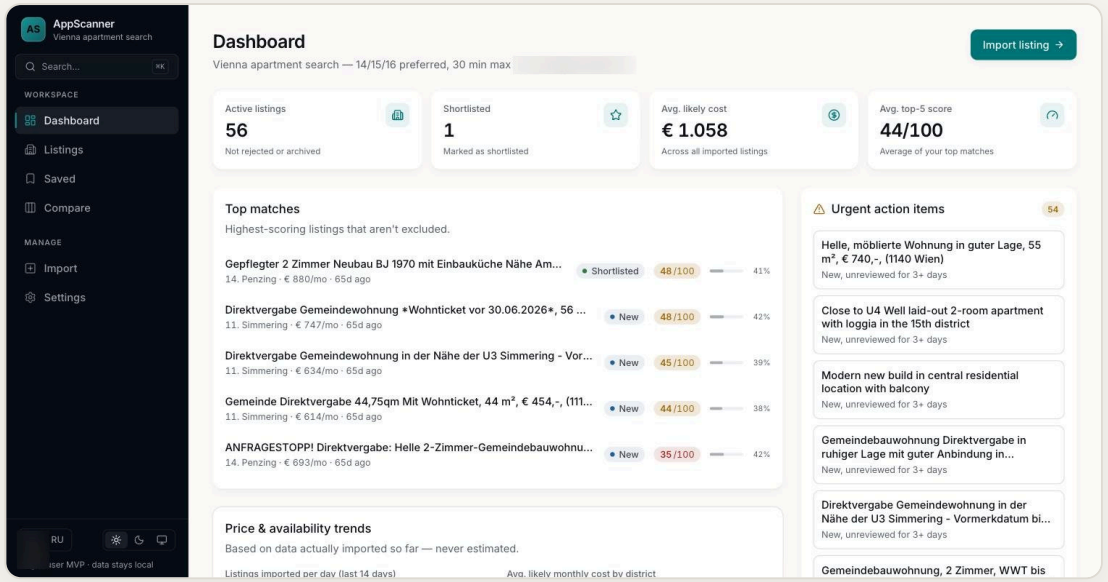

Team directory

DECISIONS WITH INCOMPLETE DATA

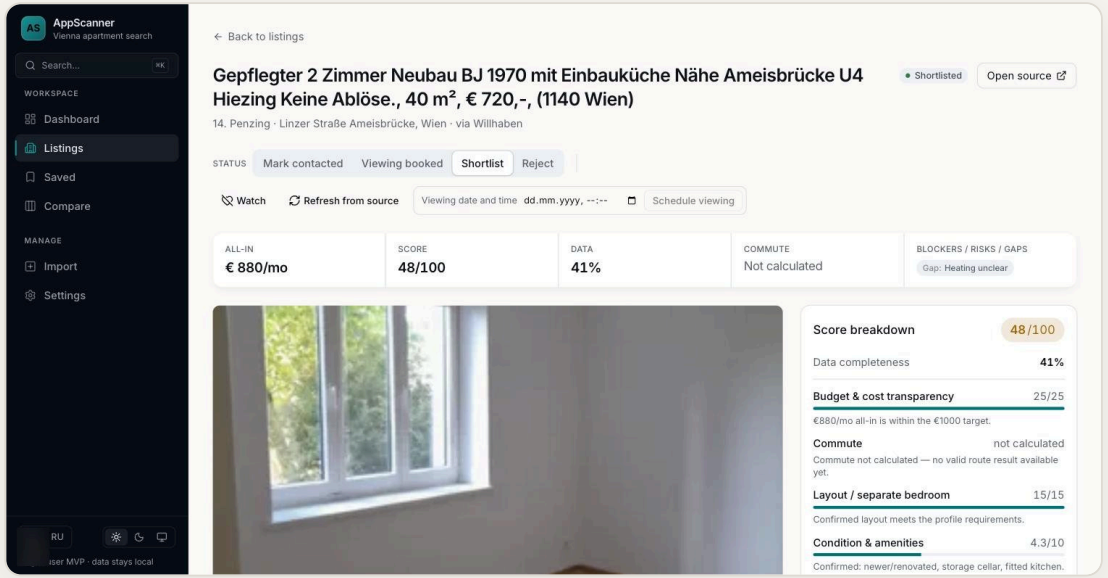

Honest about what it doesn't know

A personal tool for finding a flat in Vienna. Listings come with missing or contradicting costs, so the interface is built around confidence, not just numbers.

- **Known, likely, unknown.** Each cost shows whether it is confirmed by the listing, estimated from my profile, or still missing.
- **A score you can argue with.** Every point in the 0—100 score is explained line by line.
- **AI with receipts.** Values extracted by a model must quote the source text, otherwise they are shown as "unclear" instead of a guess.

Dashboard — top matches and what needs action

Listing — status, all-in cost, data completeness and score breakdown

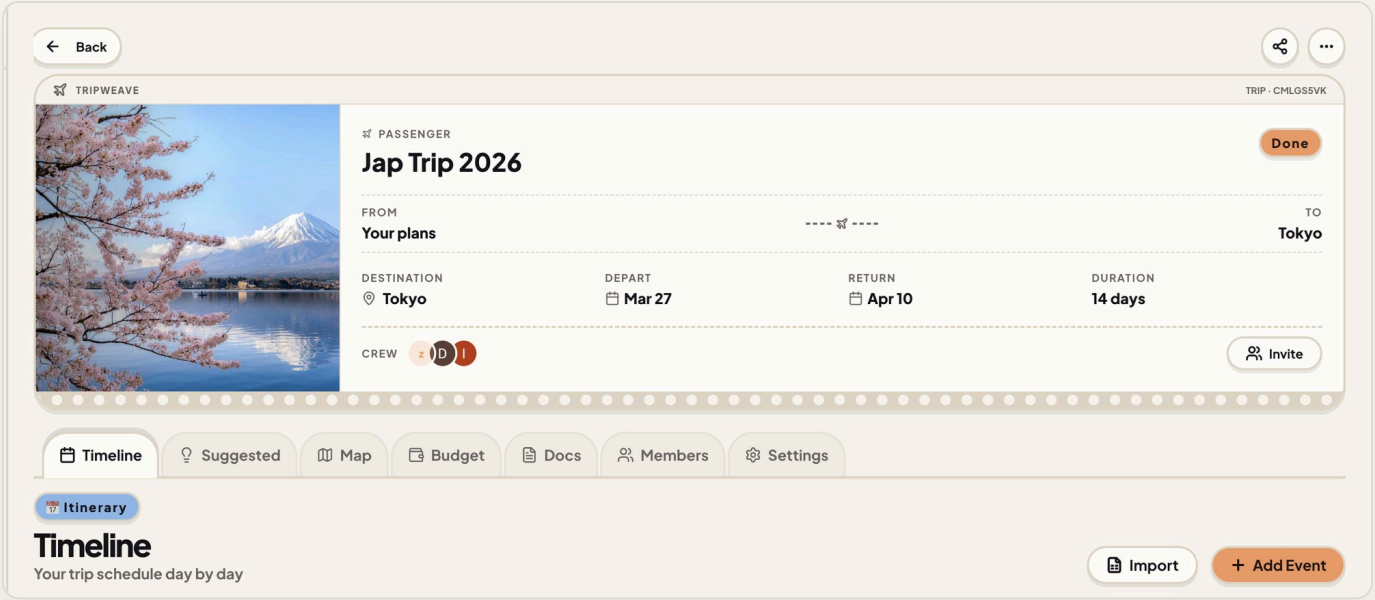

Stack Next.js, TypeScript, PostgreSQL, Prisma, Inngest, Vercel AI SDK, Playwright

COLLABORATIVE PLANNING

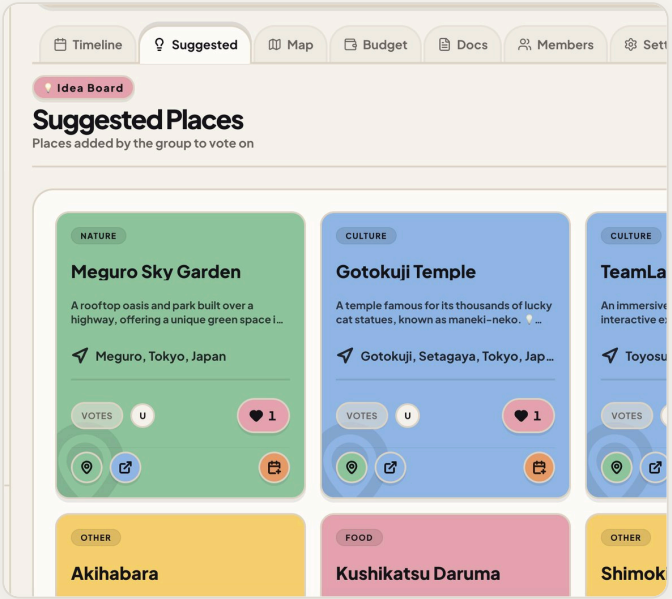

A trip the whole group can see

A shared planner for group trips: itinerary, map, budget and documents in one place, with places imported straight from TikTok, Instagram and YouTube posts.

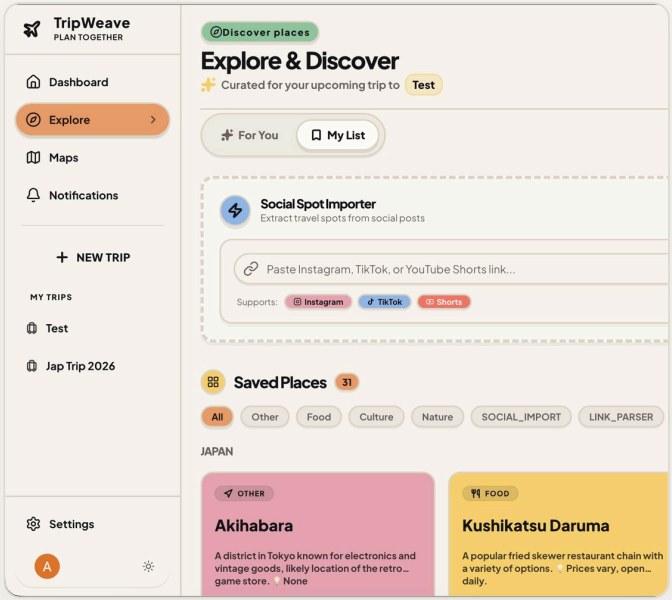

- **A board, not a spreadsheet.** Each day is a column, each plan a card with time, place, source and cost.
- **Decide together.** Anyone can suggest a place and the group votes before it goes into the plan.
- **From saved post to plan.** Vision and text models turn a social post into a place on the map, with a fallback between providers.

Trip page — ticket-style header and day-by-day board

Suggested places — the group votes

Explore — Social Spot Importer and saved places

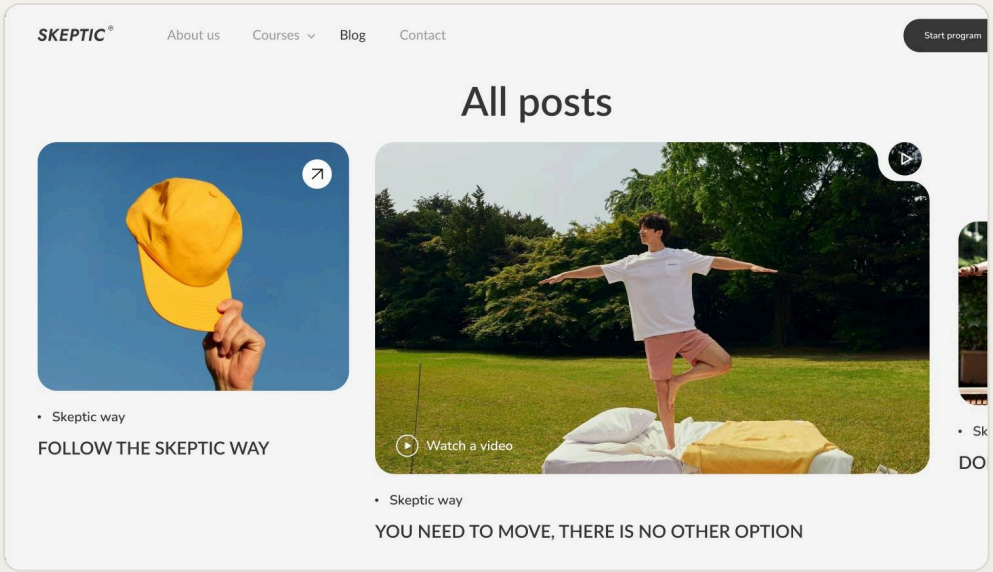

Stack Next.js, TypeScript, PostgreSQL, Prisma, Leaflet, LLM APIs

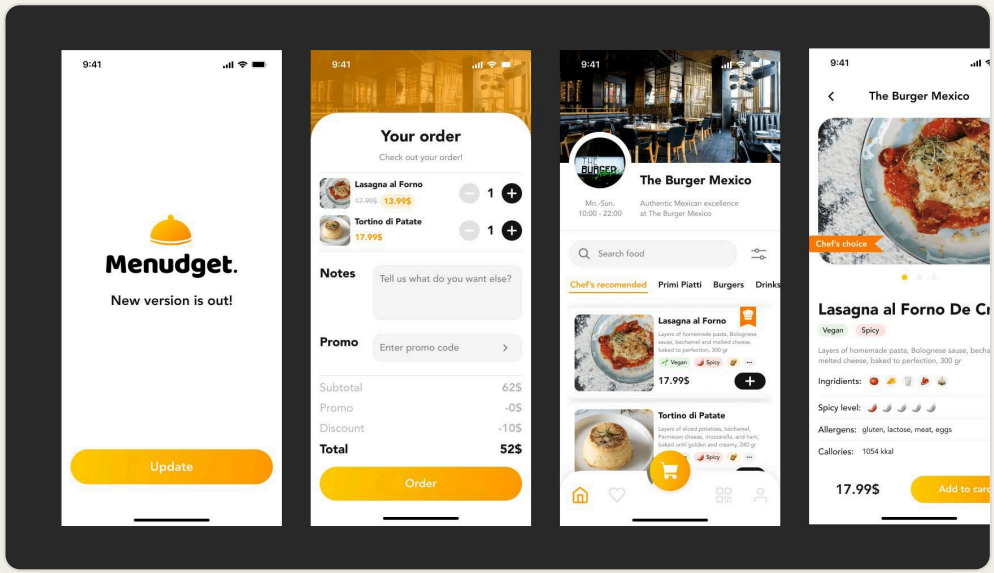

Skelya — brand and platform for a career-support service in Ukraine

Verus Property — brand identity and website for a Dubai real-estate firm

Skeptic — brand and website for an independent fitness platform

Menudget — digital menu and ordering app for restaurants

Small teams, working directly with founders; design and frontend development.

01

Start with the people

I show early versions to the people who will use them — colleagues, clients, friends — collect their feedback and change what doesn't work.

02

Design and build in one loop

Figma, components and production code stay close, so a design decision can be tested in the real product the same week, and every product shares one component library.

03

Fast, but careful

AI tools help me prototype and ship quickly; accessibility, tests and reviews keep the quality. Complex processes should feel simple to the person using them.
